For years, we have been led to believe that the universe traces its roots back to the Big Bang, a cataclysmic explosion of ethereal energy that resulted in the formation of the planets, stars, and everything in-between. Suppose, though, that the cosmos wasn't, in fact, borne of a random eruption – but rather stems from the ever-evolving imagination of a multi-dimensional dreaming mind? Such a drastically different perspective would no doubt change the way we see not only ourselves, but also our place in the infinite realm of the universe.

Such is the central premise of **The Heaven At The End Of Science**, the eye-opening new offering from author Philip Mereton. Probing, well written, and thoroughly researched, Mereton's insightful volume serves as a treatise on the popular misconceptions that the world of science would lead us to believe about the origins – and subsequent development – of the universe. More than just the simple remnants of ancient star dust, Mereton paints the compelling picture of life as a purposeful, directed means to an end. Bolstered by a wide range of enlightening sources, including religion, eastern philosophy – and science itself – **The Heaven At The End Of Science** breaks important ground regarding the limited purview of life as we've come to know it, encouraging readers to explore the unfettered depths of a new vision of universal purpose. A highly recommended read.
